ICVISP 2022

2022 6th International Conference on Vision, Image and Signal Processing (ICVISP 2022), which will be held Guangzhou, China (the conference format is to be determined) on December 9-11, 2022.

In recent years, we have seen dramatic progress being made in the areas of computer vision, image and signal processing. Computer vision is fundamental to robotics research and development. With the availability of inexpensive, consumer-grade programmable depth cameras such as Microsoft Kinect, we are seeing many interesting computer vision based applications for rehabilitation, worker safety, medical operation, retail, gaming, and education, etc.

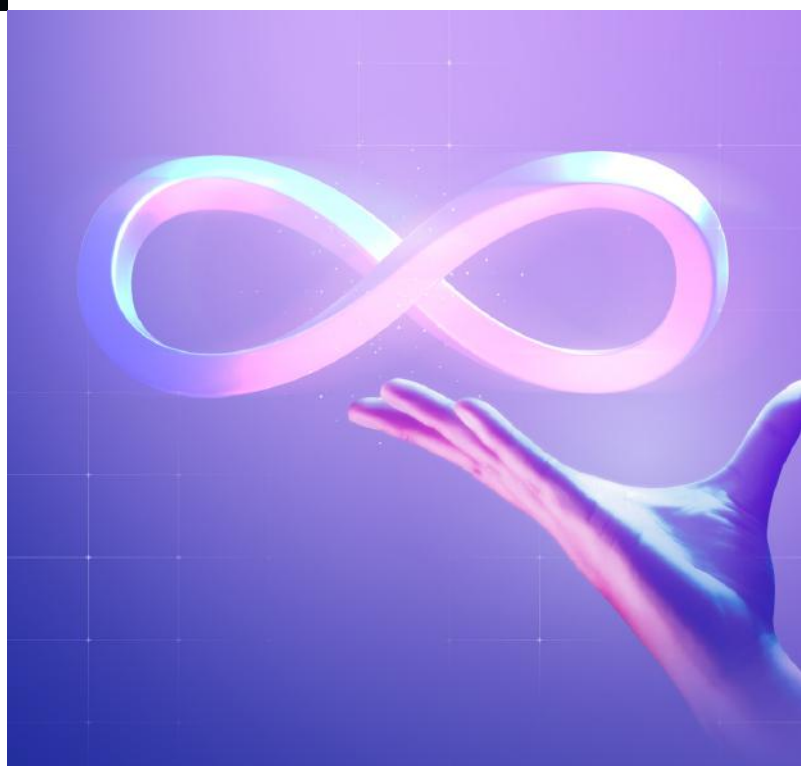

Image processing is playing an ever-important role in security (such as facial and fingerprint recognition) and medical research and practice (such as the diagnosis of various diseases). Signal processing is the foundation for making sense of various information obtained from wearable devices and Internet of Things. Indeed, it is an exciting era to see our society being transformed by technology.
